```
This sequence represents a specifically claimed peptide of the formula: V (AAA)n (AAA)n and m = 0-5, totalling 2-5; if n = 1, AAA = ABa; if n = 2, (AAA)n = Gln-AAa; and if n = 3 or more, (AAA)n = (X)D-Gln-ABa; X = any amino acid; p = 1-3, depending on value of n; m = 1, AAA = ARag; if m = 2, (AA2)n = Arg-Gly; if m = 3 or more, (AA2)n = Arg-Gly (X) q; q = 1-3, depending on value of m; v, v' and v', i, any of which may be absent, agent able to direct the compound to a specific of which may be absent. = agent able to direct the compound to a specific of which peptides are inhibitors of cysteane proteases, specifically interleukin-1 beta converting enzyme (ICB). They inhibit death of cells, particularly in humans, and can be used to treat neurodegenerative

New peptides are provided which are 16 amino acids long and which are analogues of the peptide corresponding to residues 43-58 of the Antennapedia transcription factor homeodomain (AntpHD). The peptides contain 6-10 hydrophobic amino acids. They have the general formula: X1-X2-X3-X4-X5-X7-X8-X9-X10-X11-X12-X13-X14-X15-X16 or X16-X15-X14-X13-X12-X11-X10-X9-X8-X7-TTD-X5-X4-X13-X1-X16-X16-X15-X16 are any alpha-amino acids, provided that: (1) the peptide contains 6-10 hydrophobic amino acids; (2) X3 and X5 are not both Val; and (3) the natural Antp 43-85 sequence RQIKINFONRRAWKK (i.e. the present sequence) is excluded. Specific examples of these peptides are given in AAW33416. The peptides are used as vectors for introducing into live acids. They can cross cellular membranes and reach various cell
                                                                                                                                                                                                                                                                                                                                                                                                                                              New peptide(s) of high hydrophobic amino acid content - useful as vectors for delivering peptides and nucleic acids to cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .,

The present invention describes a composition comprising an isolated oestrogen receptor activity inhibiting (anti-oestrogen) peptide. The peptides used in the composition comprise sequences of human oestrogen receptor (OR) surrounding Tyr537 and steroid receptor co-activator-1 (SCR-1). The peptide compositions, nucleic acids and vectors of the present invention can reduce OR activity in a cell, reduced OR polypeptide dimerisation in a cell and reduce the binding of SRC-1 polypeptide to an OR polypeptide dimer in a cell. They can be used for killing cancer cells and treating cancers, particularly breast cancer. The present sequence represents a specifically claimed anti-oestrogen peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Signal peptide; nuclear localisation signal; NLS; immunosuppressive activity; inhibition; nuclear translocation inhibitor; nuclear translocation; treatment; immune disorder; autoimmune disease; hypersensitivity; sepsis; prevention; septic shock; antiviral agent;
                                                                                                                                                                                                                                                                                                                                                         New anti-oestrogen peptide compositions - comprise sequences based on oestrogen receptor and steroid receptor co-activator-1 sequences, used for treating cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 92; DB 2; Length 16

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptides are provided which are 16 amino acids long and which are analogues of the peptide corresponding to residues 43-58 of the analogues of the peptide corresponding to residues 43-58 of the Antennapedia transcription factor homeodomain (Antphi). The peptides contain 6-10 hydrophobic amino acids. They have the general formula: X1-X2-X1-X4-X5-XTP-XX-X4-X3-X2-X1 in which X1-X5 and X7-X16 are any alpha-amino acids, provided that: (1) the peptide contains 6-10 hydrophobic amino acids; (2) X3 and X5 are not both Val; and (3) the hydrophobic amino acids; (2) X3 and X5 are not both Val; and (3) the hydrophobic amino acids; (2) X3 and X5 are not both Val; and (3) the cather amino acids; (4) Peptides are specific or actural Antp As 58 sequence ROINIWPONREWINKIK (see ANW33407) is excluded. The present sequence (the D-form of the 43-58 peptide) is a specific example of the new peptides. The peptides are used as vectors for introducing into live cells compounds which affect cell function, especially peptides and nucleic acids. They are as effective as helix 3 of a homeodomain peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                     Incte= "in determining the ability of this sequence to be internalised in cells, a biotin-aminopentanoyl group was attached to the N-terminal"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide(s) of high hydrophobic amino acid content - useful as vectors for delivering peptides and nucleic acids to cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, oestrogen receptor activity inhibitor; anti-oestrogen; diagnosis; breast cancer; estrogen; tumour; phosphotyrosyl peptide; malonyltyrosyl peptide; steroid receptor co-activator-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ·.

contribution numbers to represent presents asymptomes and presents of the invention. They are used to construct the nuclear translocation inhibitor polypeptides of the invention. Nuclear translocation inhibitor conjugates a signal sequence peptide capable of delivering the polypeptide comprise a signal sequence peptide capable of delivering the polypeptide through the cytoplasmic membrane into a cell, and at least 2 nuclear localisation signals. The polypeptides can be used to inhibit nuclear translocation of a cellular protein. In addition, since the nuclear translocation of certain cellular peptides is required for the host organism to mount an immune response, the polypeptide for the host organism to mount an immune response, the polypeptides can therefore be used for the treatment of immune disorders including autoimmune diseases. The polypeptides can therefore be used for the treatment of immune disorders including autoimmune diseases. The polypeptides can also be used for treating physical symptoms manifested by responses to allergens which can initiate a state of hypersensitivity, for the treatment of sepsis and in the prevention of septic shock, antiviral agents, tumour growth suppressors, and for septic shock, antiviral agents, tumour growth suppressors, and for transcriptionally modulating the expression of cellular genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                      nuclear translocation inhibitor polypeptides - comprising signal sequence for delivery through the cytoplasmic membrane and at least 2 nuclear localisation sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotide; inhibit; cell death; Nedd2; human Ich-1L gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antennapedia peptide for directing antisense oligonucleotides to a cell.

                                                                                                                                                   AAW71270 and AAW71315-16 represent antennapedia peptides which are used to, direct the antisense oligomucleotides (AAV54973-4) of the invention to a cell. The antisense oligomucleotides are used to inhibit cell death mediated by withdrawal of a trophic factor. AAV54974 inhibits the expression of a Nedd2 rodent gene, while AAV54974 inhibits expression of a human Ich-IL gene. The oligomucleotides are used to inhibit neuronal a human Ich-IL gene. The oligomucleotides are used to inhibit neuronal cell death, especially for treatment of neuronal cell death caused by e.g. aging, amyotrophic lateral sclerosis, Alzheimer's disease, Machoadodentatorubral and pallidolyusial atrophy, Huntington's disease, Machoadodoseph sensility, spinocerbellar ataxia type I, spinobulbar muscular atrophy, stroke or trauma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antennapedia peptide for directing antisense oligonucleotides to a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                         Anti-sense oligonucleotide(s) to cysteine aspartase genes - used to inhibit neurodegenerative disorder associated with e.g. ageing, Alzheimer's, Huntington's or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "N-terminal protected with 3-nitro-2-pyridyl sulphenyl group (NpyS)"

```
AAW71270 and AAW71315-16 represent antennapedia peptides which are used to, direct the antisense oligonucleotides (AAV54973-74) of the invention to a cell. The antisense oligonucleotides are used to inhibit cell death mediated by withdrawal of a trophic factor. AAV54973 inhibits the expression of a Nedd2 rodent gene, while AAV54974 inhibits expression of a human Ich-IL gene. The oligonucleotides are used to inhibit neuronal cell daath, especially for treatment of neuronal cell dath, especially for treatment of neuronal cell dath, amyotrophic lateral sclerosis, Alzheimer's disease, dachoado-Joseph disease, multiple sclerosis, muscular dystrophy, Parkinson's disease, sanility, spinocerebellar ataxia type I, spinobulbar muscular atrophy, stroke or trauma
Anti-sense oligonucleotide(s) to cysteine aspartase genes - used to inhibit neurodegenerative disorder associated with e.g. ageing, Alzheimer's, Huntington's or Parkinson's disease.

New catenin modulating agents - comprising peptides having a sequence HAV or analogues or antibodies, used for modulating cadherin-mediated functions

Claim 16; Page 78; 106pp; English.

The present sequence represents antennapedia protein derived
internalization sequence associated with cadherin modulating agents.
These agents are used for modulating cadherin-mediated functions. They
can be used for disrupting interaction between alpha-catenin and betacatenin in a cell, inhibiting cell adhesion, e.g. between epithelial
cells, endochelial cells, neural cells, tumour cells and lymphocytes,
treating a demyelinating neurological disease, e.g. multiple sclerosis,
for reducing unwanted cellular adhesion in a mammal, for enhancing the
delivery of a drug through the skin of a mammal, for enhancing the
delivery to the central nervous system of a mammal, for thanding drug
delivery to the central nervous system of a mammal, for inducing
cells and cadherin-expression cell, for modulating the immune system
of a mammal, for preventing pregnancy in a mammal, for increasing
vasopermeability in a mammal, or for inhibiting synaptic stability in a
mammal In particular they can be used for treating diabetes, rheumatoid
arthritic, allergic responses, antibody-mediated graft rejection or for
stimulating learning and memory

This sequence can be linked to the Rho binding region of the invention (AAYS100) to cause translocation across eukaryotic cell membranes. The Rho binding region is present in many Rho binding proteins, such as ROCK-IT and Kinectin and is also referent to as the ROCK/Kinectin monology domain. Rho-A is involved in many cellular processes including stress fibre formation, cell motility, cytckinesis and apoptosis. The Rho binding domain is used in the invention which relates to an assay for potential modulators of cell growth. The assay consists of a Skn7 polypeptide, a beraz polypeptide on a polypeptide consisting of a rock/Kinectin homology domain, a Rho polypeptide which binds to the previous peptide and a test compound. The modulation of the heathed is used to identify modulators, particularly antagonists, of the interaction control the host's defence system, particularly as antifungal agents. The Rock host's defence system, particularly as antifungal agents. The Rock host is defence system, particularly as antifungal agents. The Rock host is controled by the test compound to screen databases for other

The construct is a membrane-permeable construct for transport across a lipid membrane, which comparises: (a) a nucleic acid analogue apptide, and (c) a labile bond intracellular polynuclectide (PN); (b) a peptide. The membrane-permeable constructs can be used for delivery of oligonuclectides, nucleic acids and nucleic acid analogues into cells. They can be used for eg: cancer therapy, signal transduction studies, identifying new intracellular drug targets or gene therapy. They can also be used for selectively inhibiting DNA transcription, RNA translation, RNA to DNA expression, DNA replication, or an DNA or RNA regulatory function of preselected DNA or RNA sequences in a living cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New membrane-permeable constructs - comprise a peptide linked by a labile bond to a nucleic acid analogue capable of hybridising with an intracellular polynucleotide.
                                                                                                                                               Membrane-permeable construct; lipid membrane; membrane transport; oligonucleotide delivery; cancer therapy; signal transduction; inhibitor; gene therapy; transcription; translation; expression; replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention features fusion proteins that contain a calpastatin peptide and a signal sequence capable of delivering the fusion protein into a calcardate of the contains are specifically used; (a) to prevent in a cell. The fusion protein is used for the inhibition of calpain in a cell. The fusion proteins are specifically used; (a) to prevent capacity of delibrating subsequent transfusion of patelets (e.g. during storage); (b) to inhibit thyoxia-induced sickling of erythrocytes (during storage); (b) to inhibit actions storage); (c) to inhibit activation of human immune sickle cell crises); and (c) to inhibit activation of human immune of sickle cell crises); and (c) to inhibit activation of human immune viruses regulated by NP-kapabab. Other disclosed uses are: to treat or viruses regulated by NP-kapabab. Other disclosed uses are: to treat or prevent inflammation (e.g. arthritis or asthma), unwanted immune corresponses (e.g. transplant rejection), restenosis (associated with angioplasty), cancer, subarachnoid hemorrhage, vasospass, muscular dystrophy, cancer, subarachnoid hemorrhage, vasospass, defents, catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis in by-pass surgery and catheters etc.); to reduce coronary thrombosis, to prevent progression of infarction (myocardial infarction, or to prevent progression of thinbitory effec

This invention describes novel truncated and altered forms of RadSiproducts encoded by radSiTR1-131 and radSiK-A134. The products of the invention have immunosuppressive, cytostatic, antiinflammatory and antiproliferative activity. Altered and mutant forms of RadSi are useful for inhibiting cell proliferation and for promoting programmed cell death. Therapeutic agents, factors or compounds capable of disrupting the essential processes mediated by or associated with normal RadSi or RadSZ cancer, graft rejection and other proliferative and hyperproliferation, disorders. This sequence represents a fragment of the Drosophila antennapedia protein which is described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Beta-catenin, cadherin-mediated intercellular adhesion, cell differentiation, modulating agent, hair loss, skin exfoliation, internalisation moiety, flanking sequence, transcription, hearing loss.

                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                              The present invention is concerned with methods of modulating the amount of free beta-catenin in the cell, and methods of stimulating the expression of genes involved in cellular differentiation, the transcription of which is under the control of beta-catenin. The peptides given in AABZ7053-B27084, B27350 and AABZ732-B27351 can be used beta catenin, causing increased levels of the latter and stimulating the activation of beta-catenin mediated transcription. This can be used to stimulate cell differentiation, which can then be used to promote hair growth and skin exfoliation. This latter is particularly useful in the mimorovement of photocatanged skin and to mimise wrinkles. The modulating peptide can also be used to reduce hearing loss resulting from inner ear disorders such as hyperacusis and tinnitus
                                                                                                                Stimulating beta-catenin mediated gene expression, cellular differentiation and hair growth, involves contacting cells with modulating agent capable of inhibiting interaction between alpha and beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anticancer agent; cancer cell; resistance; P-glycoprotein pump; cancer.

The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport if into canner cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be passive mechanism (no receptors required), and are non-toxic and nonlytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a cell permeable peptide comprising at least the hydrophobic core of a signal peptide (or analogue) containing at least 1 additional positively charged amino acid (or analogue). The peptides are useful for the intracellular delivery of molecules, especially peptide nucleic acids to in vivo targets. The peptides are useful in commercial drug-delivery systems, in e.g. gene therapy, cancer therapy and anti-infectious agent therapy. The peptides facilitate biochemical and molecular biological research. The modified peptides facilitate intracellular delivery of any cell-impermeable substances and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New cell permeable signal peptides, useful for intracellular delivery of a molecule.
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Karposi syndrome; fibroblast growth factor; signal peptide; PNA; peptide nucleic acid; cell permeability; intracellular delivery; gene therapy; cancer.

The specification describes a protein transduction system, which comprises a fusion protein. This fusion protein a covalently linked protein transduction domain and cytotoxic domain. The system is useful for transduction domain and cytotoxic domain. The system is useful for by CMV, HSV-1, HCV, KSHV, yellow fever virus, flavivirus or thinovirus, by CMV, HSV-1, HCV, KSHV, yellow fever virus, flavivirus or thinovirus, retroviral infections such as HIV-1, HIV-2, HTVI-3 and/or LAV, plasmodial infections associated with P.faciparum, P.vivax, P.ovale, P.malariae. It
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein transduction system for treating cancer and pathogenic infections has a fusion protein comprising a protein transduction domain covalently
improve delivery into low permeability cells. Delivery into sub-
compartments can be achieved by modifying the signal peptides. The
present sequence represents a peptide used in the exemplification of the

Novel composition comprising a nuclear localization signal and an inhibitor of nuclear translocation, useful for preventing transplanted

organ or tissue rejection.

```
The invention provides a composition comprising an isolated polypeptide (I) (polypeptide inhibitor of a cellular protein nuclear translocation) which comprises a signal sequence peptide capable of delivering (I) through a cytoplasmic membrane into the cell; and a nuclear localization signal sequence (NLS) present along with an immunosuppressant. (I) or its derivatives provide useful tools for introducing an exogenous polypeptide comprising an NLS into an intact cell to inhibit nuclear translocation of a cellular protesion, for studying the role of nuclear translocation in the regulation of cellular processes. See AAVSS812 for detailed uses of (I) and compositions contianing (I). The present sequence represents a signal sequence for delivering the (I) through the cytoplasmic membrane into the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPASE (SERCA2A) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against CLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2A interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the transport peptide composed of tresidues 41-58 of antennapedia (MNT), a drosophila transport transcription factor protein. This peptide can be used to transport transcription agents across a cell membrane into the cytoplasm and nucleus
Phospholamban, PLB, sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiomyocyte; transport peptide, penetratin; cargo peptide, inhibitor; contractilin; cardiac contractility; cardiac disease; antennapedia; ANT; treatment; cardiant; heart failure; myocardial dysfunction; fruit fly.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine

Fluorogenic conjugate for intracellular fluorescence labeling, especially for performing fluorescence resonance energy transfer assays in living cells.

WPI; 2000-099447/09 Paysan J, Antz C; (PAYS/) PAYSAN J. (ANTZ/) ANTZ C.

Claim 5; Page 5; 8pp; German.

```
This invention describes a novel fluorogenic conjugate (vector) for fluorescence labeling of specific targets within cells which comprises a membrane translocation component, a targeting component and a fluorophore. A kit comprising two such conjugates; in which the fluorophores form a donor-acceptor pair for fluorescence resonance energy transfer (FRET), can be used to messure interactions between two component of the conjugates targets one of the substances and the targeting component of the conjugates targets one of the substances and the targeting component of the other conjugate targets the other substance. The conjugate to messure interactions between the targeting component of the other conjugate has a fluorophore capable of acting as a donor or acceptor for FRET with a fluorescent protein, it can be constant and cell. When the conjugate has a fluorophore capable of acting as a donor or acceptor for FRET with a fluorescent protein, it can be the functed by FRET if the targeting component targets a sequence fluorescent protein, especially in a screening assay in which the gene fluorescent protein, especially in a screening assay in which the cells are separated, preferably by means of a cell sorter or by FRET care separated, preferably by means of a cell sorter or by FRET care separated, preferably by means of a cell sorter or by FRET care separated, preferably by means of a cell sorter or by FRET capacitic blue or AMCA. The cells are especially bacterial, yeast, insect, amphibian or mammalian cells. This sequence represents a fragment of the function which is used to illustrate the method are the factor of the method of a cell sorter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

activity which comprise a nuclear localization sequence and a fragment of the retinoblastoma protein. The products of the invention have antitumor, antipporial antipporial antipporial antipporial antipporial antipporial antipporial antipporial antipporial and protein antipporial and protein antipporial and or hyperprofileration of cells, specifically benign or malignant tumors (sepecially of the breast), atherosclerosis and psoriasis. (I) are more active against proliferation than similar reduced, thus also reducing the cost. They destroy amost all types of tumor cells, especially those in which the retinoblastoma gene or protein is defective, but have relatively ittle effect on normal cells, which is in contrast to conventional chemotherapeutic agents. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a fragment of the Antennapedia protein (amino acids 43-58) from Drosophila. The fragment is used as a translocating protein in the course of the invention. The specification describes a method for modulating cellular process and for delivery of functional protein sequences. The method comprises contacting a cell in culture under suitable conditions with a cell process modifying molecule attached to a translocating polypeptide, where molecule is translocated into the cell and interacts specifically with a responsive target site. The method is useful for modulating a cellular process, such as modulating expression of a target gene product, of a cell in culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modulating a cellular process by contacting a cell in culture with a process modifying molecule attached to a translocating polypeptide, useful for modulating expression of a target gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antennapedia protein; translocating protein; cellular process;

                                                                                                                                                                                                                                                                                                    This invention describes a novel phage whose head part contains a bifunctional protein with nuclear transport and cell adhesion activities. The phage is used as a vector for transport of foreign genes into a cell nucleus for gene therapy. This sequence represents a peptide fragment which is used in the method of the invention
                                                                                                                                                                                                                    carrying in its head part a bifunctional nuclear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel peptides (I) with high antiproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptide with high antiproliferative activity, useful for treating cancer or psoriasis, comprises a nuclear localization sequence and a fragment of the retinoblastoma protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to the use of linear peptides, coupled to an active agent, to prepare a composition able the cross the blood-brain barrier for diagnosis or treatment of disorders localised in the central nervous system. The linear peptide preferably has the formula: (a) XI-XI6; (b); BXXBXXXXBBXXXXXBBXXXXBBXB, where: each of XI-XI6 are amino acids (aa), of which 6-10 of them are hydrophobic and X6 must be and each X is an aliphatic or aromatic a. The linear peptide may be retro forms of (a)-(c) containing D- and/or L-form as dragment containing at least 5, preferably at least 7 consecutive as fragment containing at least 5, preferably at least 7 consecutive as fragment exchyplesins, transportan, etc. Of these several families have cytolytic effects and are termed peptide antibiotics. They fall into 3 main categories based on their structure: (i) peptides with alpha-helices, e.g. protegrin, tachyplesins, defensins; (ii) peptides with alpha-helices of e.g. bactericins and PR39. The peptides of the invention fall into the peptide antibiotic categories defensins; (iii) peptides are based on the Antennapedia family peptides; (b)-peptides are based on the Antennapedia family peptides; (b)-peptides are based on the Antennapedia family peptides; (b)-peptides are based on the Rotchylesins.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for modulating beta-catenin mediated gene transcription in a cell. The method involves contacting a cell with a modulating agent comprising an internalization moiety and a peptide comprising a sequence IXXIL or peptide analogue of IXXIL. The method is useful for modulating beta-catenin mediated gene transcription, cell differentiation, hair growth, and retinoic acid activity, for treating cancer, and for inhibiting the development of Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          alization molety and a peptide,
transcription and cell
for inhibiting Alzheimer's
                                                                                                                                     ü
represents a synthetic linear peptide designed on peptides able to crothe BBB and is conjugated to a doxorubicin molecule by a succinimydyl maleimido-propionate-3-mercaptopropionate linker. Conjugates of the linear peptides and the active agent are particularly used to treat, prevent or diagnose brain cancer, Alzheimer's or Parkinson's diseases, depression, pain and meningitis, but also for studying drug behaviour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US-09-116-294-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 7, Application Us/09072429

Patent No. 5962415
GENERAL INFORMATION:
GENERAL FOR COMPRISING A PEPTIDE
TITLE OF INVENTION: INHIBITOR OF NUCLEAR PROTEIN TRANSLOCATION AND AN
TITLE OF INVENTION: IMMUNSUPPRESSANT AND METHODS OF USE THEREOF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                    US-09-155-165-2

1 Sequence 2.2. Application US/09155165

1 Patent NO. 6660830

2 GENERAL INFORMATION:

APPLICANT: Radulascu, Razvan T

1 TILE OF INVENTION:

FILE REPERENCE: 201196/20

CURRENT FILING DATE: 1999-06-07

PRIOR PAPLICATION NUMBER: 09/155,165

PRIOR APPLICATION NUMBER: PC7/06943

PRIOR PILING DATE: 1999-09-22

PRIOR PILING DATE: 1998-09-22

PRIOR PILING DATE: 1996-03-26

PRIOR PILING DATE: 1996-12-20

PRIOR PILING DATE: 1996-12-20

PRIOR PILING DATE: 1996-12-20

NUMBER OF SEQ ID NOS: 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

APPLICANT: Burke, James
APPLICANT: Burke, James
APPLICANT: Strittmater, Warren
APPLICANT: Strittmater, Warren
APPLICANT: Strittmater, Warren
APPLICANT: Oxfoliate
TITLE OF INVENTION: COMPOUNDS THAT SELECTIVELY BIND TO EXPANDED POLYGLUTAMINE REPEAT I
TITLE OF INVENTION: AND METHODS OF USE THEREOF
FILE REFERENCE: 5405.242
CURRENT APPLICATION NUMBER: US/09/780,070
CURRENT APPLICATION NUMBER: 60/189,781
PRIOR APPLICATION NUMBER: 60/189,781
PRIOR PLILING DATE: 2000-03-16
NUMBER OF SEQ ID NOS: 40
SEQ THAN E: Patentin version 3.0
SEQ ID NO.38
LENGTH: 16
APPLICANT: Bottger, Angelica
APPLICANT: Chene, Parick
APPLICANT: Hochkeppel, Heinz-Kurt
APPLICANT: Freet, Pascal
APPLICANT: Freet, Pascal
APPLICANT: Freet, Pascal
APPLICANT: Freet, Pascal
TITLE OF INVENTION: Inhibitors of the Interaction of P53 and MDM2
FILE REFERENCE: 4-20937/A/PCT
CURRENT APPLICATION NUMBER: 10509/214,371B
CURRENT FILING DATE: 1990-03-26
PRIOR APPLICATION NUMBER: PCT/EP97/03549
PRIOR FILING DATE: 1997-07-04

homeotic protein Hox B6 - human (fragment)

NyAlternate names: homeotic protein Hox 2B; homeotic protein Hu2
C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)
C;Species: homeotic protein Hox 2B; homeotic protein Hu2
C;Species: Homo sapiens (man)
C;Accession: A05266; 31537

S;Levine, M.; Rubin, G.M.; Tjian, R.
Cell 39, 667-673, 1984
A;Title: Human DNA sequences homologous to a protein coding region conserved between home

"Homeobox-containing genes in the newt are organized in clusters similar to other vertebrates.";
Gene 114:179-186(1992).
-!-FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!-SUBCELLULAR LOCATION: Nuclear.
-!-SUBLERLULAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                            from Atlantic salmon.";

Gene 65:141-152(1988).

-!- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.

-!- SUBCELLUTAR LOCATION: Nuclear.

-!- SIMILARITY: Belongs to the Antp homeobox family.

                                                                                                                                                                                                                                                                                                                                                                                                                           Development 105:639-650(1989).

-!- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!- SUBCELLULAR LOCATION Nuclear.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                    HOXBS OR GHOX-2.1.

Development 105:639-650(1989).
-- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides calls with specific positional identities on the anterior-posterior axis.
--- SUBCELDUAR LOCATION: Nuclear.
--- SIMILARITY: Belongs to the Antp homeobox family.

-!- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!- SUBCELLUAR LOCATION: Nuclear.
-!- SUBCELLUAR LOCATION: Nuclear.
-!- SIMILARITY: BELONGS TO THE ANTP HOMEOBOX FAMILY. STRONGEST, TO SCR OF DROSOPHILM.

-!- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.

-!- SUBCELLUMAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE FROM N.A. MEDINES-2904133; MEDINES-89057478; PubMed=2904133; MAILLE J.R., Gaunt S.J., Sharpe P.T.; "Pig Hox-2.4 has accumulated a frameshift mutation relative to mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                 a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-:- SUBCELLULAR LOCATION, Nuclear.
-:- DEVELOPMENTAL STAGE: EXPRESSED EXCLUSIVELY IN EARLY EMBRYOS.
-:- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R BMB1, X07105; CAA30126.1; -

-!- SUBCELLUTAR LOCATION: Nuclear.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

"Zebrafish hox genes: expression in the hindbarin region of wild-type and mutants of the segmentation gene, valentino.";

Submitted (JUN-1997) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-! SUBCELLUIAR LOCATION: Nuclear.
-! SUMILARITY: Belongs to the Antp homeobox family. Deformed
                                                                                                                                                                                                           Gaps

Development 103:601-610(1988).
-!- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!- SUBCELULAR LOCATION: Nuclear.
-!- TISSUE SPECIFICITY: Predominantly spinal cord and kidney.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Submitted (Apd.1995) to the EMBL/Genbank/DDBD databases.
-!- PUNCTION: Sequence-specific transcription factor which is part of
a developmental regulatory system that provides cells with
specific positional identities on the anterior-posterior axis.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Heterodontus francisci (Horn shark).
